GENERAL INFORMATION
                                                                                                  Sequence 150, Application US/08839765
; Sequence 150, Application US/08839765
; Patent No. 6146631
; GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Studnika, Gary M.
ITILE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating
TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 169
; CORRESPONDENCE ADDRESS: 169
; CORRESPONDENCE ADDRESS: 169
; ADDRESSEE: MCAndrewa, Held & Malloy, Ltd.
STREET: 500 West Madison Street, 34th floor
CITY: Chicago
; STATE: Illinois
; CONNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match 100.0%; Score 53; DB 3; Length 108; Best Local Similarity 100.0%; Pred. OM protein - protein search, using sw model

April 21, 2004, 17:25:48; Search time 3.55072 Seconds (without alignments) 102.653 Million cell updates/sec Run on:

SEQ5 31 1 atssrat 7

Title: Perfect score: Sequence:

Scoring table: BLOSUM62 Gapop 10.0, Gapext 0.5

141681 segs, 52070155 residues Searched:

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_42:\*

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Chen Y., Di Y.P., Wu R.; Chen Y., Di Y.P., Wu R.; Mulecular cloning of the amino-terminal and 5'-flanking region of thuman MUCSB mucin gene."; Submitted (NOV-1998) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                              Nature 402:769-777 (1999).

-!- CATALYTIC ACTIVITY: ATP + pyruvate = ADP + phosphoenolpyruvate.

-!- COPACTOR: Requires magnesium and potassium.

-!- PATHWAY: Glycolysis; final step.

-!- PATHWAY: Homotetramer (By similarity).

-!- SUBUNIT: Homotetramer (By similarity).

-!- SUBCELLUIAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: Belongs to the pyruvate kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Genomic organization of the 3 region of the human MUCSB mucin.";

J. Biol. Chem. 272:16873-16883(1997).

-!-FUNCION: Salivary mucin that is thought to contribute to the lubricating and viscoelastic properties of whole saliva.

-!-FUNCION: Salivary mucin that is thought to contribute to the lubricating and viscoelastic properties of whole saliva.

-!- SUNCELULAR LOCATION: Secreted.

-!- STRICATION: Socreted.

-!- FTM: Highly glycosylated.

-!- FTM: Highly glycosylated.

-!- FTM: Highly glycosylated.

-!- STMILARITY: Contains 3 VWFC domains.

-!- SIMILARITY: Contains 4 VWFD domains.

-!- SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.
                                                                                                                                                                                                                                                                                                                   SEQUENCE OF 40-1324 FROM N.A.

Sakamoro T., Kurimura T., Wakamiya N.;

Toloning and characterization of a cDNA encoding bovine mannan-binding

Totoin.", Gene 186:161-165(1997).

C-1- FUNCTION: Binds mannose and N-acetylglucosamine in a calcium-
dependent manner. Is capable of host defense against pathogens, by
activating the classical complement pathway independently of the
continue of the classical complement complement pathway independently of the
continue of the classical complement pathway independently of the
continue of the classical complement complement complement complement complement complement complement complement.

C-1- SIMILARITY: Contains I collagenous domain.

C-1- SIMILARITY: Contains I C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MABC_BOVIN STANDARD, PRT; 249 AA.

Trames and are expressed through transcriptional editing.";

Trames and are expressed through transcriptional editing.";

Transcriptions: Structural protein that forms the virion spike and which is responsible for binding to target cells and subsequent fusion of the viral and host-cell membranes. In cell receptor recognition of the viral and host-cell membrane process.

C. -- SUBMIT: Homotriner; each monomer consist of a GP1 and a GP2 subunit linked by disulfide bonds (By similarity).

C. -- SUBMIT: CACATION: Type I membrane processing (By similarity).

C. -- PTM: N-GJYCOSYJARCG, could also be O-GJYCOSYJAtcd (By similarity).

"Cloning and charaterization of phospholipase B gene (PLB2) of Candida
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -i. FUNCTION: Catalyzes the release of fatty acids from
lysophospholipids. Phospholipase B may well contribute to
pathogenicity by abetting the fungus in damaging and traversing
pathogenicity by abetting the fungus in damaging and traversing
host cell membranes, processes which likely increase the rapidity
of disseminated infection (By similarity).
-!- CATALYTIC ACTIVITY: 2-lysophosphatidylcholine + H(2)0 =
glycerophosphocholine + a fatty acid anion.
-!- SUBCELLULAR LOCATION Secreted (Probable).
-!- SIMILARITY: Belongs to the lysophospholipase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                GLCUNC. ) (POTENTIAL)

DURING THE NEXT 3 EMBRYONIC DAYS THE LEVELS OF 8-REXS INCREASES AND REMAINS STABLE AT E13 IN THE HINDERAIN AND AT E14 IN THE FOREBRAIN. THE LEVELS OF S-REXB DOES NOT CHANGE AS SIGNIFICANTLY DURING DEVELOPMENT OF THE HINDERAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Event-alternative splicing; Named isoforms=2;

```
reveals striking active-site conservation.";

Nat. Struct. Biol. 6:233-242(1999).

-! FUNCTION: Produces nitric oxide (NO) which is a messenger molecule with diverse functions throughout the body. In macrophages, NO mediates tumoricidal and bactericidal actions.

-!- CATALYTIC ACTIVITY: L-arginine + N NADPH + M O(2) = citrulline + nitric oxide + N NADP(+).

-! COPACTOR: Heme. Binds now mole each of FAD and FAM. Also requires tetrahydrobiopterin (BH4) which may stabilize the dimeric form of the enzyme (By similarity).

-!- ENZYME REGULATION: Regulated by calcium/calmodulin (in contrast with mouse NOS2). Aspirin inhibits expression and function of this enzyme and effects may be exerted at the level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   X.FAY CRYSTALLOGRAPHY (2.55 ANGSTROMS) OF 74-504.

Marucional characterization of a heteromeric NWDA receptor channel
T. expressed from cloned cDNAs.";
Mature 357:70-74(1992).
I. Nature 257:70-74(1992).
I. SUBUNIT: Heterodimer of an epsilon subunit and a zeta subunit.
I. SUBCELLULAR LOCATION: Integral membrane protein.
I. SUMILARITY: Belongs to the ligand-gated ionic channel family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Receptor; Postsynaptic membrane; Ionic channel; Glycoprotein; Signal; Transmembrane; Calcium; Magnesium.

-I-FUNCTION: MNDA receptor subtype of glutamate-gated ion channels
possesses high calcium permeability and voltage-dependent
sensitivity to magnesium and is mediated by glycine.
-I-SUBUNIT: Heterodimer of an epsilon subunit and a zeta subunit.

Bhatia A;

Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris. WPI; 2001-616774/71. N-PSDB; AAS59515.

Example 1; SEQ ID NO 2811; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO synovicis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory

seq5.open.rag

```
lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a mample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used a diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Mitcham JL, Skeiky YAW, Persing DH, Bhatia A, Maisonneuve JL; Zhang Y, Wang S, Jen S, Lodes MJ, Benson DR, Jones R, Carter D; Barth B, Vallieve-Douglass J;

WPI; 2003-381789/36. N-PSDB; ACF64444. New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. Example 1; SEQ ID NO 2811; 1481pp; English. The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (BBM35634-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polynucleotide of the invention, antibodies against polypeptides of the invention, antibodies against polypeptides of the invention, comprising a polypeptide of the invention, an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method of a vaccine composition (comprising P. acnes polypeptides,

polynucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne volgaris, or for stimulating an immune response specific for a P. acnes protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polynucleotides of the reading frame) contained within the P. acnes polynucleotides of the reading frame) but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/bublished\_pot\_gequences %

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by per acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acnes ulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used a diagnostic agents for determining P. acnes presence, for example, by chis patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                   SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endopthalmitis; bone; joint, central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Propionibacterium acnes predicted ORF-encoded polypeptide #2404.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 28; DB 4; Length 59;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel purified or isolated Cryptococcus neoformans nucleic acid molecule comprising a sequence encoding a polypeptide comprising a sequence not given in the specification. A polynucleotide of the invention has fungicide activity, and may have a use in gene therapy. The nucleic acid is useful for preparing a composition for treating an infection caused by Cryptococcus neoformans. The present sequence represents a C. neoformans sequence of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pat_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated polynuclectide (ACF64435-ACF64733)

encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynuclectides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a division proteins comprising a polypeptide of the invention; a polymerlectide and an isolated T cell population comprising T cells prepared to the method, a vaccine composition (comprising P. acnes polypeptides, polymerlectides, antibodies, fusion proteins, T cell populations, or artigen-presenting cells that express the polypeptide); a method and an isolated T cell population or comprising P. acnes polypeptides, polymuclectides, and an express the polypeptide); a method and kit for detecting or determining the presence of P. acnes in a consideration. The populations or antigen-presenting cells that express the polypeptides in a patient, and a method for inhibiting the development of P. acnes in a patient, and a method for inhibiting the development of P. acnes in a patient, and a method for inhibiting the gevelopment of P. acnes in contraining the presenting cells that express the polymeric acid hybridisation. The polymerlectides are useful for diagnosing, preventing or treating acnes protein. The polymuclectides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulating a frame) contained within the P. acnes polymeric assay. The present cand the kit is useful for performing a diagnostic assay. The present cand the kit is useful for performing a diagnostic assay. The present cand the kit is useful to performing a diagnostic assay. The present cand the kit is assumented by an office the printed specification, but was obtained in electronic format directly contained by contained in electronic format directly contained aperior and th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the treatment, prevention and diagnosis of medical conditions caused by cares. The disorders include SAPHO syndrome (syndritis, acne, pustulosis, hypertosis and osteomyealitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acnes in a patient comprises contacting to resence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to charged the expression and activity of P. acnes proteins. The antibodies may also be used as diagnosic agents for determining P. acnes proteins. The antibodies may also be used as diagnosic agents for determining P. acnes proteins. The antibodies may also be used as diagnosic agents for determining P. acnes proteins the acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnosic agents for determining P. acnes proteins for expression and activity of P. acnes polypeptides and the antibodies may also be used as diagnosic agents for determining P. acnes proteins the sequence data for this patent did not form part of Labrined specification, but was contactined in the account directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Example 1; SEQ ID NO 11615; 1069pp; English

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by practices. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyellite), uvertis and endophthalmitis. The acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes proper acnes proteins. The autibodies and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by chis patent did not form part of the printed specification, but was chis patent did not form part of the printed specification, but was ftp.wipo.int/pub/published\_pct\_sequences

Novel human polypeptides and polynuclectides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

Disclosure; SEQ ID NO 6374; 1037pp; English.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABNIST62 to ABNIST25 encode the human ORFX proteins given in ABP00010 to ABPI1500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a squances can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, proteins in the carding a treatment of cancer, hyperproliferative disorders, infrhosis of liver, proteins in the carding a treatment of cancer, hyperproliferative disorders, info in the carding burntation, cardiovascular diseases, disorders related to organ carding anterior, aradiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders infectious closus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also cuseful for treating burns, incisions, ulcers, for treating observation and treatment of lung or liver fibrosis, protection or regeneration and treatment of lung or liver fibrosis, corpection or regeneration and treatment of lung or liver fibrosis, ergemic cytokine damage. NB. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic corpused form part of the printed specification, but was obtained in electronic corpus of the printed specification, the propertion of the printed specification, but was obtained and electronic corpus of the printed specification, the very sequence of the printed specification of the printed specification intropublished pot electronic corp

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (BABM5624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a distribution in the invention; additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; and encoding a minute response specific for a . acnes constituted and an isolated T cell population comprising T cells prepared via this method, a vaccine composition (Comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigner-presenting cells that express the polypeptide); a method and activate and an expense the polypeptide, a method and kit cfor detecting or determining the presence of P. acnes in a consider that present an expectation or antigner-presenting cells that express the polypeptides, polymuclations or antigen-presenting cells that express the polypeptides, polymuclation or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne to protein. The polymuclations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne controlled an immune response against P. acnes, or for treating acnes the protein. The polymuclacides can also be used as probes or primers for candito frame of an immune response against P. acnes, or for treating acnes and the kit is useful for performing a diagnostic assay. The present content of the printed specification, but was obtained in electronic format directly from without the polymuclacides and all across polymented in electronic format directly from particular and electronic format directly from with an electronic format directly and an electronic formation. ô New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

cenceding a Propionibacterium acnes protein. The invention also relates to polymeptides encoded by the polymucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polymeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a convention; fusion proteins comprising a polymeptide of the invention; a comprising an immune response specific for a P. acnes for invention; fusion proteins comprising p. polymeptides of the invention; a composition (comprising T. cells prepared to invention; a method a vaccine composition (comprising T. cells prepared to polymeptides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polymeptide; a method and kit conferential cells that express the polymeptide; and method for inhibiting the development of P. acnes in a conference of patient, and a method for inhibiting the development of P. acnes in a proteins; T cell populations or antigen-presenting cells that express the colymeptides are useful for diagnosing, preventing or treating acnes to polymeptides are useful for diagnosing, preventing or treating acnes to polymeptides are useful for diagnosing, preventing or treating acnes to protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the performing a diagnostic assay. The present or sequence represents a polymeptide predicted to be encoded by an ORF (open the printed specification, but was obtained in electronic format directly to the printed specification, but was obtained in electronic format directly contained in the polymention. New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. Propionibacterium acnes predicted ORF-encoded polypeptide #27340. Acne vulgaris, antiseborrhoeic, dermatological, antibacterial; immunostimulant, immune response; vaccine. ```
The invention relates to a secretory polynucleotide (designated sptm) comprising any of 567 polynucleotide sequences (AB255837-AB236403), a naturally occurring polynucleotide sequence at least 90 % identical to the polynucleotide sequence, a polynucleotide complementary to them or an KNA equivalent of them. The polypeptide or polynucleotide are useful for treating, preventing or diagnosing a disease or condition associated with the expression of functional SPTM. These are particularly useful for the expression of functional SPTM. These are particularly useful for diagnosing, treating or preventing autoimmune/Ainfammatory disorders (e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's disease), neurological disorders (e.g. epilepsy, Huntington's disease,
                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human secretory proteins and polynucleotides, useful for diagnosing, treating or preventing autoimmune/inflammatory disorders (e.g. AIDS), neurological disorders (e.g. Alzheimer's), or cell proliferations or

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPNO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uvaitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention
                                                                                                                                                                                                                                                                                       ö
dementia, stroke, Alzheimer's disease, Creutzfeldt-Jakob disease, multiple sclerosis, cerebral palsy, Parkinson's disease, anxiety, schizophrenia or amnesia), or cell proliferative disorders (e.g. psoriasis, polycythemia vera or cancers including adenocarinoma, leukaemia, lymphoma, melanoma, myeloma, sarcoma or cancers of the brain, breast, cerrix or prostate). The present sequence is one of the SpTM proteins of the invention (ABP75384-ABP75962). Note: The sequence data for this patent did not form part of the printed specfication, but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful treating acne vulgaris.
                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bhatia A;

```
and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to down-regulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Sequence 41459, Application No. US20040034888A1

Sequence 41459, Application No. US2004003488BA1

GENERAL INFORMATION:
APPLICANT: Liu, Jingdong
APPLICANT: Zhou, Yihua
APPLICANT: Screen, Steven E
APPLICANT: Screen, Steven E
APPLICANT: Cao, Yongwei
TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With
TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement
FIR REFERENCE: 38-21(5313)B
CURRENT APPLICATION NUMBER: US/10/425,114

CURRENT FILING DAIE: 2003-04-28

NUMBER OF SEQ ID NOS: 73128

SEQ ID NO 41459

General Information US/09252991A

Patent No. 655195

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 22477
LENGTH: 270
                                            Sequence 17126, Application US/09252991A

Sequence 17126, Application US/09252991A

Batent No. 6551795

GENERAL INFORMATION:
APPLICANT:
MATC J. Rubenfield et al.
APPLICANT:
MATC J. Rubenfield et al.
TITLE OF INVENTION:
NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOWONAS
TITLE OF INVENTION:
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PELING DATE: 1998-02-18
PRIOR PELING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 17126

LENGTH: 262
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 19612, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARROGIONOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 262;

Title: Perfect score: Sequence:

Scoring table: BLOSUM62

141681 seqs, 52070155 residues Gapop 10.0 , Gapext 0.5

Searched:

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_42:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
